RTY	CRIT			
CAUTION AND WARNING SYSTEM SWITCH, ITEM 368	2/2	368FN01: Electrical open in status display request position.	END ITEM: Unable to request EMU status display.	A. Realign - The stationary contacts are part of the external terminal lugs. No interconnecting wiring to fail. Each switch position has dual contacts for redundancy. Switching mechanism and contacts are encased in a hermetically sealed case backfilled with dry nitrogen. Contact is accomplished through a roller type contact. This minimizes switching forces. Operating force is 4 + 2 lbs. The switch is designed to withstand a toggle force of 25 lbs. without degradation. The lead wires (H22759/12) are soldered to the external switch terminals per WNB5300.4 (3A-1). This area is then potted with stycast to provide strain relief for the leads. The wire bundle is designed to withstand a pull force of 8 lbs. without damage or degradation.
SV767792-2 (1)		CAUSES: Severed wire lead or connection, linkage mechanism fractured.	DFE INTERFACE: Loss of display capability, loss of EVA time clock, time left on consumables, and actual sensor readouts.	B. Test - Component Acceptance Test - Vendor acceptance tests include 500 actuation cycles, contact resistance, and dielectric withstanding voltage tests.
			MISSION: Loss of use of one EMU.	In-Process Test - Switch operation and continuity are verified during four separate In-process tests during DCM Item 350 assembly.
			CREW/VEHICLE: None.	PQA Test - Proper operations is verified during DCM PQA which includes continuity, functional tests, and operational torque. The switch is vibrated and exposed to thermal cycles during PQA as part of the DCM.
				Certification Test - The item completed the 15 structural vibration and shock cart requirements during 10/83. The item was cycle certified for 127,000 cycles during 6/85. No Class I Engineering changes have been issued since this configuration was certified.
				C. Inspection - The external lead wires are inspected for damage as part of source inspection for the part and again during assembly of the DCM. To preclude failure due to internal contamination, the switches are assembled by the vendor in a

QTY				
2/2	368FM01z			Class 100,000 clean room. The switches are flushed internally using chlorotrifluoroethane 80 and Genesolvite 0 to remove contaminants prior to class welding. After welding the switches are vacuum baked and back filled with OME to a pressure of 3-5 psig and sealed. Leak checks are performed during subsequent processing to verify seal integrity. Two X-ray inspections are performed, prior to run-in cycling and after vibration, to verify absence of weld splatter and loose pieces, and to verify contact alignment.

D. Failure History -

None.

E. Ground Turnaround -

Tested per FEMU-R-001, Transducer and DCM Gauge Calibration Check.

F. Operational Use -

Crew Response - PreEVA: When detected during periodic status check, troubleshoot using RTDS. Terminate EVA prep. EVA: When detected during periodic status check, troubleshoot using RTDS. Terminate EVA.

Training - Standard EMU training covers this failure mode. Operational Considerations - EVA checklist procedures verify hardware integrity and systems operational status prior to EVA. Flight rules define go/no go criteria related to EMU DMS. Real Time Data System allows ground monitoring of EMU systems.
